

When it comes to accessibility tools. I chose NVDA due to having windows.

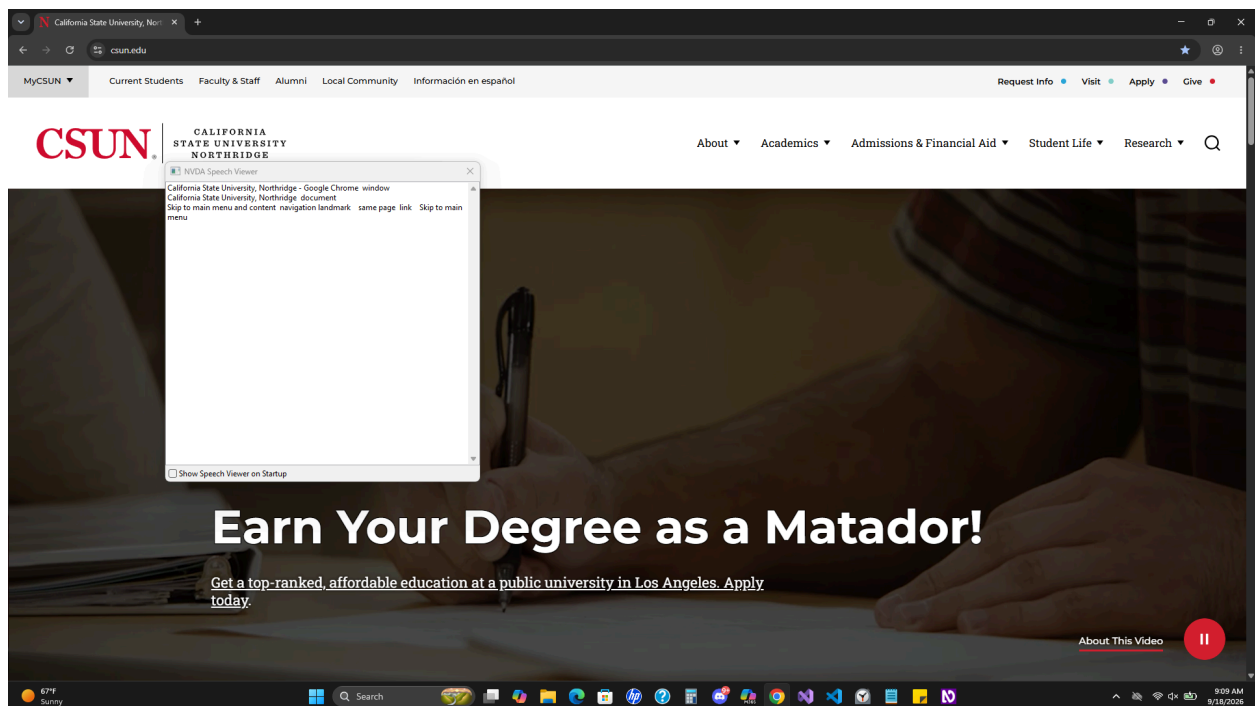

Pro:

- Once I got the hang of it. I saw the benefits such as the speech feature for those that can not read but hear. It was fun to see it used on my personal site.
- Another benefit is the braille feature that can help with those that may be able to use it.
- The application would have modularity for updates to issues that may come in the future.
- For google chrome the highlight feature helps for those that can see but need extra help to focus on what they are clicking.

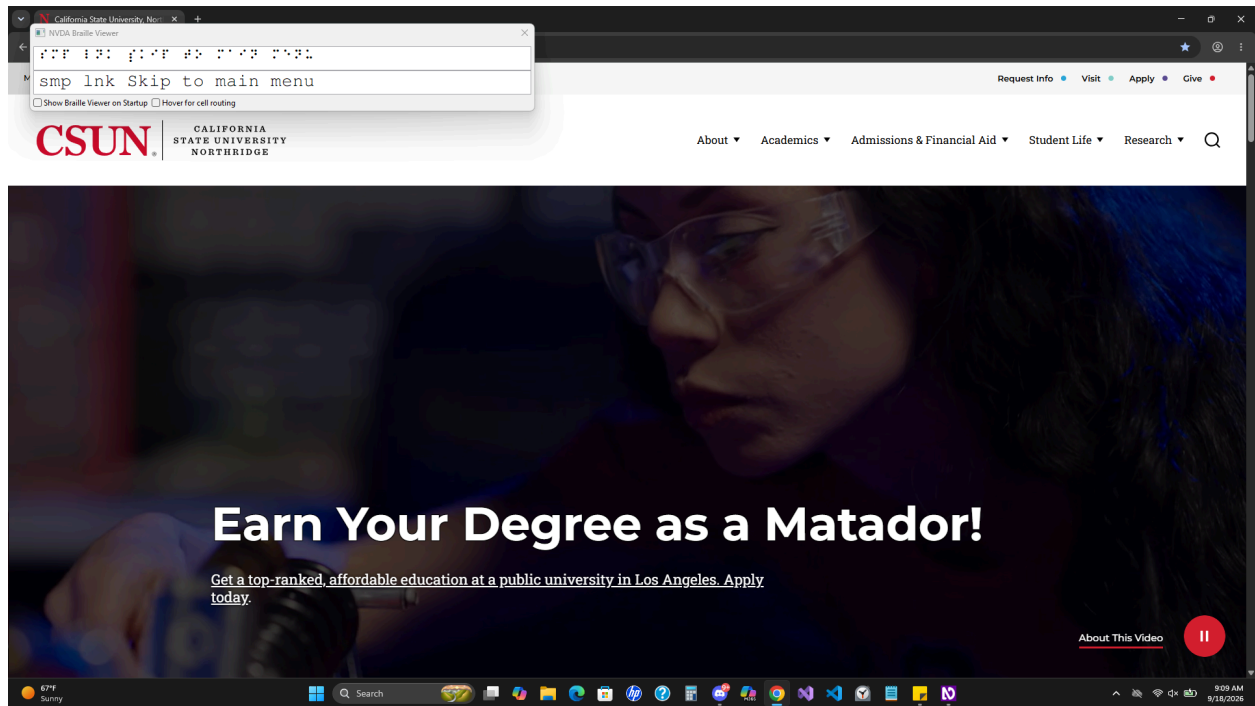

Cons:

- I noticed though installation was easy. There was no explanation of how to access it. I only learn through google. This being a problem, imagine the person in question doing this by themselves.
- This leads into a question of what happens if no one is around to help set up this product. This may be a problem of someone that may not be computer literate and having difficulty even setting the program up.
- With google chrome I was able to find the settings due to using it for a while. New users may not be able to even get the settings they want.

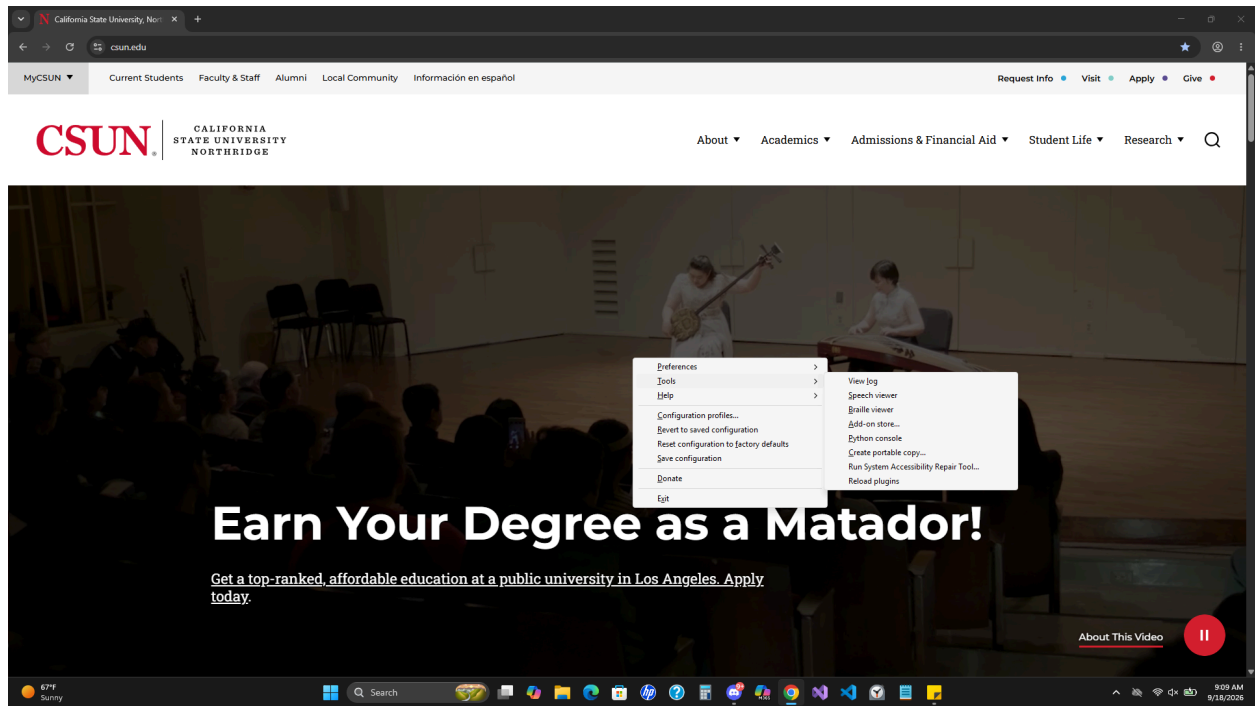

Speech viewer

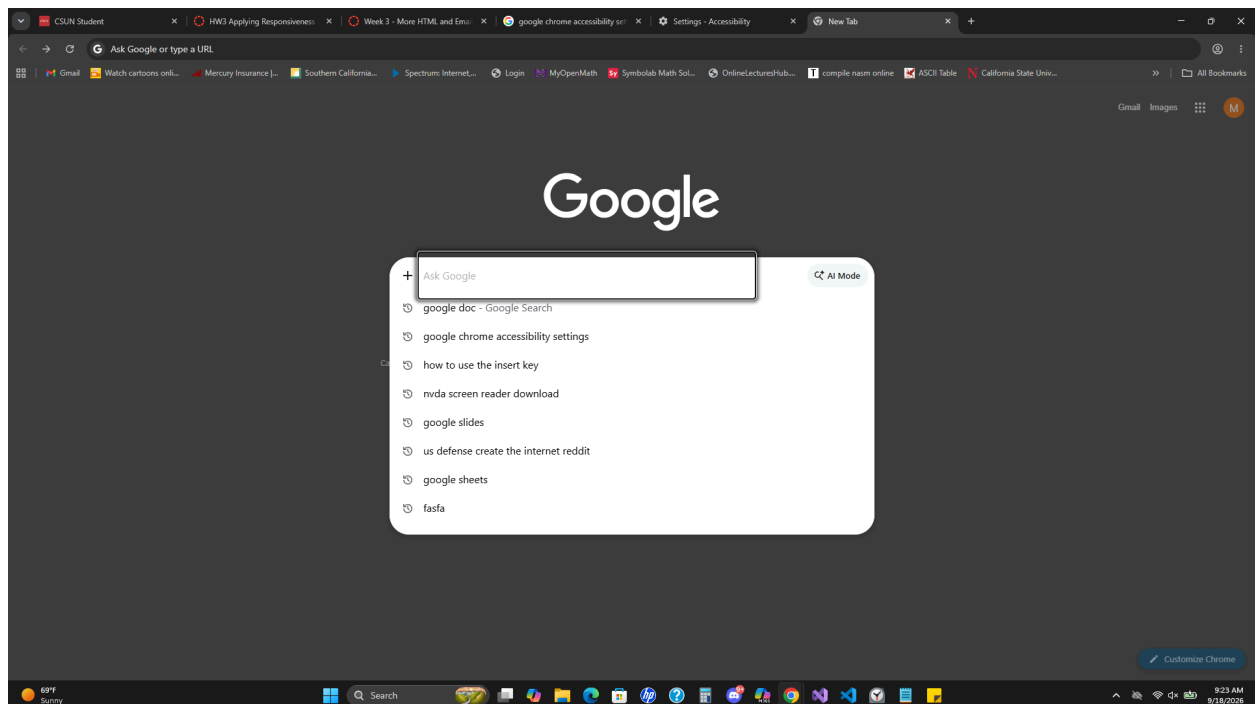

Braille function

NVDA help menu

Google chrome highlight feature

Screen viewer on personal email project
